## Principal Component Analysis: The Olympic Heptathlon

### 13.1 Introduction

### 13.2 Principal Component Analysis

### 13.3 Analysis Using R

To begin it will help to score all the seven events in the same direction, so that ‘large’ values are ‘good’. We will recode the running events to achieve this;

```
R> data("heptathlon", package = "HSAUR")
R> heptathlon$hurdles <- max(heptathlon$hurdles) -
+   heptathlon$hurdles
R> heptathlon$run200m <- max(heptathlon$run200m) -
+   heptathlon$run200m
R> heptathlon$run800m <- max(heptathlon$run800m) -
+   heptathlon$run800m
```

Figure 13.1 shows a scatterplot matrix of the results from the 25 competitors on the seven events. We see that most pairs of events are positively correlated to a greater or lesser degree. The exceptions all involve the javelin event – this is the only really ‘technical’ event and it is clear that training to become successful in the other six ‘power’-based events makes this event difficult for the majority of the competitors. We can examine the numerical values of the correlations by applying the `cor` function

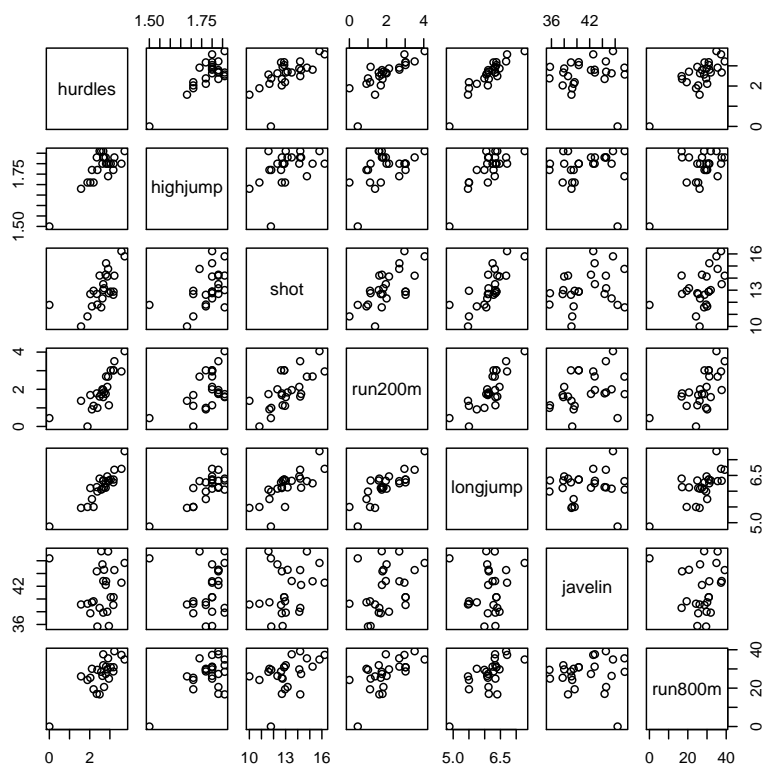

```
R> round(cor(heptathlon[, -score]), 2)
```

	<i>hurdles</i>	<i>highjump</i>	<i>shot</i>	<i>run200m</i>	<i>longjump</i>	<i>javelin</i>	<i>run800m</i>
<i>hurdles</i>	1.00	0.81	0.65	0.77	0.91	0.01	0.78
<i>highjump</i>	0.81	1.00	0.44	0.49	0.78	0.00	0.59
<i>shot</i>	0.65	0.44	1.00	0.68	0.74	0.27	0.42
<i>run200m</i>	0.77	0.49	0.68	1.00	0.82	0.33	0.62
<i>longjump</i>	0.91	0.78	0.74	0.82	1.00	0.07	0.70
<i>javelin</i>	0.01	0.00	0.27	0.33	0.07	1.00	-0.02
<i>run800m</i>	0.78	0.59	0.42	0.62	0.70	-0.02	1.00

This correlation matrix demonstrates again the points made earlier.

A principal component analysis of the data can be applied using the `prcomp` function. The result is a list containing the coefficients defining each component (sometimes referred to as *loadings*), the principal component scores, etc. The required code is (omitting the `score` variable)

```
R> score <- which(colnames(heptathlon) == "score")
R> plot(heptathlon[, -score])
```

**Figure 13.1** Scatterplot matrix for the `heptathlon` data.

```
R> heptathlon_pca <- prcomp(heptathlon[, -score], scale = TRUE)
R> print(heptathlon_pca)
```

Standard deviations:

```
[1] 2.1119364 1.0928497 0.7218131 0.6761411 0.4952441 0.2701029
[7] 0.2213617
```

Rotation:

	PC1	PC2	PC3	PC4
<i>hurdles</i>	-0.4528710	0.15792058	-0.04514996	0.02653873
<i>highjump</i>	-0.3771992	0.24807386	-0.36777902	0.67999172
<i>shot</i>	-0.3630725	-0.28940743	0.67618919	0.12431725
<i>run200m</i>	-0.4078950	-0.26038545	0.08359211	-0.36106580
<i>longjump</i>	-0.4562318	0.05587394	0.13931653	0.11129249

```
javelin -0.0754090 -0.84169212 -0.47156016 0.12079924
run800m -0.3749594 0.22448984 -0.39585671 -0.60341130
      PC5      PC6      PC7
hurdles -0.09494792 -0.78334101 0.38024707
highjump 0.01879888 0.09939981 -0.43393114
shot      0.51165201 -0.05085983 -0.21762491
run200m -0.64983404 0.02495639 -0.45338483
longjump -0.18429810 0.59020972 0.61206388
javelin 0.13510669 -0.02724076 0.17294667
run800m 0.50432116 0.15555520 -0.09830963
```

The `summary` method can be used for further inspection of the details:

```
R> summary(heptathlon_pca)
```

*Importance of components:*

	PC1	PC2	PC3	PC4	PC5	PC6
Standard deviation	2.112	1.093	0.7218	0.6761	0.4952	0.2701
Proportion of Variance	0.637	0.171	0.0744	0.0653	0.0350	0.0104
Cumulative Proportion	0.637	0.808	0.8822	0.9475	0.9826	0.9930

	PC7
Standard deviation	0.221
Proportion of Variance	0.007
Cumulative Proportion	1.000

The linear combination for the first principal component is

```
R> a1 <- heptathlon_pca$rotation[, 1]
R> a1
```

```
hurdles highjump shot run200m longjump
-0.4528710 -0.3771992 -0.3630725 -0.4078950 -0.4562318
javelin run800m
-0.0754090 -0.3749594
```

We see that the 200m and long jump competitions receive the highest weight but the javelin result is less important. For computing the first principal component, the data need to be rescaled appropriately. The center and the scaling used by `prcomp` internally can be extracted from the `heptathlon_pca` via

```
R> center <- heptathlon_pca$center
R> scale <- heptathlon_pca$scale
```

Now, we can apply the `scale` function to the data and multiply with the loadings matrix in order to compute the first principal component score for each competitor

```
R> hm <- as.matrix(heptathlon[, -score])
R> drop(scale(hm, center = center, scale = scale) %*%
+ heptathlon_pca$rotation[, 1])
```

The first two components account for 81% of the variance. A barplot of each component's variance (see Figure 13.2) shows how the first two components dominate. A plot of the data in the space of the first two principal components, with the points labelled by the name of the corresponding competitor can be produced as shown with Figure 13.3. In addition, the first two loadings for the events are given in a second coordinate system, also illustrating the special role of the javelin event. This graphical representation is known as *biplot* (?).

The correlation between the score given to each athlete by the standard scoring system used for the heptathlon and the first principal component score can be found from

```
R> cor(heptathlon$score, heptathlon_pca$x[, 1])
```

```
R> plot(heptathlon_pca)
```

**Figure 13.2** Barplot of the variances explained by the principal components.

```
[1] -0.9910978
```

This implies that the first principal component is in good agreement with the score assigned to the athletes by official Olympic rules; a scatterplot of the official score and the first principal component is given in Figure 13.4.

```
R> biplot(heptathlon_pca, col = c("gray", "black"))
```

**Figure 13.3** Biplot of the (scaled) first two principal components.

```
R> plot(heptathlon$score, heptathlon_pca$x[, 1])
```

**Figure 13.4** Scatterplot of the score assigned to each athlete in 1988 and the first principal component.
