| Title A Two-Stage Estimation Approach to Cox Regression Using M-Spline Function | |
| Version 0.0.3 | |
| Maintainer Ren Teranishi <ren.teranishi1227@gmail.com></ren.teranishi1227@gmail.com> | |
| Description Implements a two-stage estimation approach for Cox regression using five-parameter M-spline functions to model the baseline hazard. It allows for flexible hazard shapes and model selection based on log-likelihood criteria. | |

2 splineCox.reg1

splineCox.reg1

Fitting the five-parameter spline Cox model giving a specified shape

Description

splineCox.reg1 estimates the parameters of a five-parameter spline Cox model based on a specified shape for the baseline hazard function. The function calculates the estimates for the model parameters (beta) and the baseline hazard scale parameter (gamma), using non-linear optimization. If a numeric vector is provided for the model parameter, it will be normalized to have an L1 norm of 1. Additionally, if plot = TRUE, the function generates a plot of the estimated baseline hazard function with 95% confidence intervals. The x-axis represents time, and the y-axis represents the estimated hazard. The solid line indicates the estimated hazard function, while the dashed red lines represent the confidence intervals.

Usage

```
splineCox.reg1(
    t.event,
    event,
    Z,
    xi1 = min(t.event),
    xi3 = max(t.event),
    model = "constant",
    p0 = rep(0, 1 + ncol(as.matrix(Z))),
    plot = TRUE
)
```

Arguments

| t.event | a vector for time-to-event |
|---------|--|
| event | a vector for event indicator (=1 event; =0 censoring) |
| Z | a matrix for covariates; $nrow(Z)$ =sample size, $ncol(Z)$ =the number of covariates |
| xi1 | lower bound for the hazard function; the default is min(t.event) |
| xi3 | upper bound for the hazard function; the default is max(t.event) |
| model | A character string specifying the shape of the baseline hazard function or a numeric vector of length 5 representing custom weights. If a numeric vector is provided, it will be normalized to have an L1 norm of 1. Available options include: "increase", "constant", "decrease", "unimodal1", "unimodal2", "unimodal3", "bathtub1", "bathtub2", "bathtub3". Default is "constant" |
| p0 | Initial values to maximize the likelihood (1 + p parameters; baseline hazard scale parameter and p regression coefficients) |
| plot | A logical value indicating whether to plot the estimated baseline hazard function. If TRUE, a plot is generated displaying the estimated baseline hazard function along with its 95% confidence intervals. The x-axis represents time, and the y-axis represents the estimated hazard. The solid line indicates the estimated |

splineCox.reg2 3

hazard function, while the dashed red lines represent the confidence intervals. Default is TRUE.

Value

A list containing the following components:

model A shape of the baseline hazard function or the normalized custom numeric vec-

tor used.

parameter A numeric vector of the parameters defining the baseline hazard shape.

beta A named vector with the estimates, standard errors, and 95% confidence inter-

vals for the regression coefficients

gamma A named vector with the estimate, standard error, and 95% confidence interval

for the baseline hazard parameter

loglik A named vector containing the log-likelihood (LogLikelihood), Akaike Infor-

mation Criterion (AIC), and Bayesian Information Criterion (BIC)

plot A baseline hazard function plot (if plot = TRUE).

Examples

```
# Example data
library(joint.Cox)
data(dataOvarian)
t.event = dataOvarian$t.event
event = dataOvarian$event
Z = dataOvarian$CXCL12
reg1 <- splineCox.reg1(t.event, event, Z, model = "constant")
print(reg1)</pre>
```

splineCox.reg2 Fitting the five-parameter spline Cox model with a specified shape, selecting the best fit

Description

splineCox.reg2 estimates the parameters of a five-parameter spline Cox model for multiple specified shapes and selects the best-fitting model based on the maximization of the log-likelihood function. This function supports predefined model shapes and custom numeric vectors of length 5. If numeric vectors are provided, they will be normalized to have an L1 norm of 1. Additionally, if plot = TRUE, the function generates a plot of the estimated baseline hazard function for the best-fitting model, along with its 95% confidence intervals. The x-axis represents time, and the y-axis represents the estimated hazard. The solid line indicates the estimated hazard function, while the dashed red lines represent the confidence intervals.

4 splineCox.reg2

Usage

```
splineCox.reg2(
    t.event,
    event,
    Z,
    xi1 = min(t.event),
    xi3 = max(t.event),
    model = names(shape.list),
    p0 = rep(0, 1 + ncol(as.matrix(Z))),
    plot = TRUE
)
```

Arguments

| t.event a vector | r for time-to-event |
|------------------|---------------------|
|------------------|---------------------|

event a vector for event indicator (=1 event; =0 censoring)

Z a matrix for covariates; nrow(Z)=sample size, ncol(Z)=the number of covariates

xi1 lower bound for the hazard function; the default is min(t.event)
xi3 upper bound for the hazard function; the default is max(t.event)

model A list of character strings and/or numeric vectors of length 5 specifying the

shapes of the baseline hazard function to evaluate. Character options include: "increase", "constant", "decrease", "unimodal1", "unimodal2", "unimodal3", "bathtub1", "bathtub2", "bathtub3". Numeric vectors must be of length 5 and will be normalized to have an L1 norm of 1. Default is names(shape.list), which

includes all predefined models.

p0 Initial values to maximize the likelihood (1 + p parameters; baseline hazard scale

parameter and p regression coefficients)

plot A logical value indicating whether to plot the estimated baseline hazard func-

tion. If TRUE, a plot is generated displaying the estimated baseline hazard function along with its 95% confidence intervals. The x-axis represents time, and the y-axis represents the estimated hazard. The solid line indicates the estimated hazard function, while the dashed red lines represent the confidence intervals.

Default is TRUE.

Value

A list containing the following components:

model A character string indicating the shape of the baseline hazard function used.

parameter A numeric vector of the parameters defining the baseline hazard shape.

beta A named vector with the estimates, standard errors, and 95% confidence inter-

vals for the regression coefficients

gamma A named vector with the estimate, standard error, and 95% confidence interval

for the baseline hazard parameter

splineCox.reg2 5

loglik A named vector containing the log-likelihood (LogLikelihood), Akaike Infor-

mation Criterion (AIC), and Bayesian Information Criterion (BIC) for the best-

fitting model

other_models A data frame containing the log-likelihood (LogLikelihood) for all other eval-

uated models, with model names as row names.

plot A baseline hazard function plot for the best-fitting model (if plot = TRUE).

Examples

```
# Example data
library(joint.Cox)
data(dataOvarian)
t.event = dataOvarian$t.event
event = dataOvarian$event
Z = dataOvarian$CXCL12

M = c("constant", "increase", "decrease")
reg2 <- splineCox.reg2(t.event, event, Z, model = M)
print(reg2)</pre>
```
